1. This office action, in response to the remarks and declaration filed after final, is a non-final office action.

Response to Arguments

- 2. Applicant's request for reconsideration of the finality of the rejection of the last Office action is persuasive and, therefore, the finality of that action is withdrawn.
- 3. Applicant's arguments with respect to the rejections of the pending claim have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground of rejection is made in view of Lee (EP 1 017 183 A2).

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 4. Claims 1-14 and 16-30 are rejected under 35 U.S.C. 102(b) as being anticipated by Lee (EP 1 017 183 A2).

Regarding claims 1 and 8, Lee discloses a method for the despreading of spread spectrum signals in a digital signal processor. The process is performed in response to the generation to the single instruction by placing in the data path a DSP process that will perform the despreading operation by performing various multiplications,

Art Unit: 2611

summations and accumulations, all in a single instruction cycle (abstract). The despreading operation of the spread spectrum RAKE receiver consists of a process involving multiply-and-accumulate (MAC) operations for complex valued quantities (paragraph 0007).

Regarding claims 2 and 9, the method further includes including a previous result from a previous instruction in the complex addition which provides the despread result (paragraph 0009).

Regarding claims 3 and 10, the spreading factor is disclosed in paragraph 0005.

Regarding claims 4, 5, 11 and 12, the PN sequence is a sequence of +1 and -1 for the I and Q components (paragraph 0007).

Regarding claims 6, 7, 13 and 14, the incoming signal is stored in buffers of size N. the signal comprises real and imaginary bits (paragraph 0016).

Regarding claim 16, Lee discloses a digital signal processor shown in figure 1. The processor includes a memory 322, instruction generator 316, in path processor block 310 and numerous process blocks 320. The digital signal processor executes a method for the despreading of spread spectrum signals in a digital signal processor. The process is performed in response to the generation to the single instruction by placing in the data path a DSP process that will perform the despreading operation by performing various multiplications, summations and accumulations, all in a single instruction cycle (abstract). The despreading operation of the spread spectrum RAKE receiver consists of a process involving multiply-and-accumulate (MAC) operations for complex valued quantities (paragraph 0007).

Application/Control Number: 09/925,889

Art Unit: 2611

Regarding claim 17, the spreading factor is disclosed in paragraph 0005.

Regarding claims 18 and 19, the PN sequence is a sequence of +1 and –1 for the I and Q components (paragraph 0007).

Regarding claims 20 and 21, the incoming signal is stored in buffers of size N. the signal comprises real and imaginary bits (paragraph 0016).

Regarding claim 22, Lee discloses a method for calculating output data in a digital signal processor. The process is performed in response to the generation to the single instruction by placing in the data path a DSP process that will perform the despreading operation by performing various multiplications, summations and accumulations, all in a single instruction cycle (abstract). The operation of the DSP consists of a process involving multiply-and-accumulate (MAC) operations for complex valued quantities (paragraph 0007).

Regarding claim 23, the PN sequence is a sequence of +1 and –1 for the I and Q components (paragraph 0007).

Regarding claims 24 and 25, the method despreads an incoming signal (abstract).

Regarding claim 26, the received signal is a spread spectrum/CDMA signal (abstract).

Regarding claim 27, Lee discloses a method for calculating output data in a digital signal processor. The process is performed in response to the generation to the single instruction by placing in the data path a DSP process that will perform the despreading operation by performing multiplication in a single instruction cycle

Application/Control Number: 09/925,889

Art Unit: 2611

(abstract). The operation of the DSP consists of a process involving multiply-and-accumulate (MAC) operations for complex valued quantities (paragraph 0007).

Regarding claim 28, Lee discloses a method for calculating output data in a digital signal processor. The process is performed in response to the generation to the single instruction by placing in the data path a DSP process that will perform the despreading operation by performing various multiplications, summations and accumulations, all in a single instruction cycle (abstract). The operation of the DSP consists of a process involving multiply-and-accumulate (MAC) operations for complex valued quantities (paragraph 0007).

Regarding claim 29, the incoming signal is stored in buffers of size N. the signal comprises real and imaginary bits (paragraph 0016).

Regarding claim 30, the PN sequence is a sequence of +1 and –1 for the I and Q components (paragraph 0007).

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Peleg et al (US 6,035,316) discloses in response to a single instruction (column 5, lines 25-30), complex multiplication and addition is carried out in a single clock cycle (column 22, lines 1-14). The processed data is then stored (column 3, line 63 to column 4, line 22). Takewa et al (US 6,092,183) discloses calculating an output signal in response to a single instruction, performing complex multiplication in a single clock cycle (figure 2a). Pechanek et al (US 7,072,929) discloses an apparatus for

Application/Control Number: 09/925,889 Page 6

Art Unit: 2611

the single cycle computation comprising multiplier means, adder means and storage means (column 11, line 62 to column 12, line 39).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin M. Burd whose telephone number is (571) 272-3008. The examiner can normally be reached on Monday - Friday 9 am - 5 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jay Patel can be reached on (571) 272-2988. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
